

TRAIL CLOSED

Trail not closed on Sundays

The project goal is to support safe emergency evacuation and emergency access, and create defensible spaces inside the facility. Currently there are numerous trees and shrubby fuels near buildings and roads that are critical fire risks to people and property. Trees can also fall and block traffic during emergencies. Treatments are designed to convert existing fire-prone trees and dead underbrush with more naturally fire resilient vegetation that will then be maintained over time. Most native trees and shrubs will be retained and pruned as needed.
